

Zone Loading And Doors:-

To create a zone load that uses a door, rather than a separate trigger, do the following:-

- 1) Create an event group to do the zone switch (eg "ZoneMain_To_ZoneOutDoors")
- 2) Copy the parameters from the current zone switch trigger into the event group, changing the message to NM_ZONESWITCH_DOOR eg :-

Trigger Parameter:- NM_CHARENTRY global_zonemanager user parameter
Becomes NM_ZONESWITCH_DOOR global__zonemanager user parameter

- 3) Delete the zone switch trigger

- 3) Bind the event group to NM_OPEN on the door

- 4) Make sure that the door is auto closing (1 second). If the door isn't auto close (you can check this by looking at it's event bindings), the easiest way to make it auto close is to delete the door trigger and create a new one.

That's it...
